

ABSTRACT OF THE DISCLOSURE

An OSD multi cursor display method and apparatus are provided, wherein an OSD source transmits a plurality of OSD multi cursor display data to a display apparatus by giving each data a peculiar ID, said display apparatus stores the plurality of received OSD multi cursor display data in a memory, said OSD source transmits only an OSD multi cursor ID and display location information to said display apparatus, and said display apparatus reads an OSD multi cursor display data of a corresponding ID and displays the data on a screen at a given cursor display location. Since only a plurality of OSD multi cursor data is transmitted initially, and thereafter only the ID of the OSD multi cursor and the display location information are transmitted, the amount of data in transmission is reduced, the processing speed becomes faster, and an OSD multi cursor can be displayed smoothly on a screen.
